

Breast cancer cases have hit a new record, recently released official figures reveal.

Yet fewer than 50% of cases are attributed to acknowledged 'risk' factors – age, obesity, late-age pregnancy, late onset of menopause.

**So, a question for the government
in Breast Cancer Awareness month.**

WHY **ARE** MORE AND MORE OF US GETTING BREAST CANCER?

**This campaign message
is supported by the following:**

Breast Cancer UK
Cancer Prevention and Education Society
Green Party
Health & Environment Alliance
Scottish Breast Cancer Campaign
Soil Association
UK Public Health Association
Unison
Women in Europe for a Common Future
Women's Environmental Network
Women's Environmental Network, Scotland
WWF

**The No More Breast Cancer campaign wants
the possible link between breast cancer
and everyday exposure to toxic chemicals
taken seriously.**

To date, government, industry and mainstream cancer organisations have refuted this possibility.

We argue that lifelong, low-level exposure to the cocktail of hundreds of toxics and hormone-disruptors in our everyday lives – from pesticide residues in food to chemicals in consumer products and in the workplace – is linked to ever-rising rates of the disease.

So Breast Cancer Awareness month is an appropriate time for the British government to mark a new approach by ensuring the new EU chemicals policy (REACH) requires substitution of all carcinogenic and hormone-disrupting chemicals with safer alternatives as soon as they are available.
